

# H2O Vac Turbo

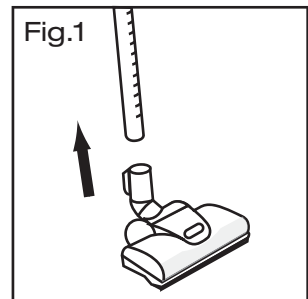

## Power Brush

### User's Guide

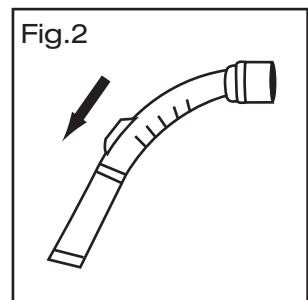

The air powered brush is specially designed to be used with the H2O Vac Turbo vacuum cleaner. A bottom portion of the brush body is open so that an air is introduced therein. An air powered rotatable roller located at the bottom portion of the power brush body picks up dust by making contact with a floor. Ideal for cleaning and restoring carpets and other floors.

1. Attached the power brush to the telescopic handle as any other attachment, as illustrated in Fig.1.

2. Plug in the H2O Vac Turbo vacuum cleaner and press the power switch to start up. The power brush will start rotating. The brush rotates very fast and helps you remove hair and as well as more dust than the vacuum without the brush would be able to.

3. To control the suction power adjust the Suction Power Control Button located on the curved handle attached to the telescopic hose, as illustrated in Fig.2. For full suction power select CLOSED position; to reduce suction power select OPEN position. You can also adjust the suction power by pressing speed switch, for more suction power press higher speed and vice versa (for more info please refer to the H2O Vac Turbo manual)

4. Regularly check and remove accumulated hair and other dirt on the rotating brush. It is easy to remove the hair if the brush doesn't have much on it. Otherwise, the scissors will be a handy tool. Also, occasionally remove the black cover located at the bottom of the power brush and remove any accumulated dirt from a pair of driving fans, as illustrated in Fig.3.
